Abstract

The invention provides a system and method for managing cached objects using notification bonds. A server is configured to manage original objects. A client creates cached objects from the original objects and establishes notification bonds with

5   the server. Each notification bond enables the client to obtain a notification from the server in response to an object related event associated with an original object. The client uses the data in the notification to update the cache object corresponding to the original object without synchronizing other cache objects.
